

# ABAP Core Data Services

## Deep Dive on New Features and Capabilities

Konrad Gaerdes, Andrea Schlotthauer  
User Assistance Developers at SAP BTP ABAP, SAP SE

June 6, 2024

# Agenda

- 01** The Role of ABAP CDS in the ABAP Cloud Development Model
- 02** New Kids on the Block
  - CDS simple types
  - CDS enumerated types
  - CDS scalar functions
- 03** Roadmap
- 04** Knowledge Resources for ABAP CDS

# THE ROLE OF ABAP CDS IN THE ABAP CLOUD DEVELOPMENT MODEL

# Use cases

ABAP CDS is part of the golden path technology recommendation for data modeling in the ABAP Cloud development model. Using ABAP Cloud means using ABAP CDS.

## ABAP CDS IS THE FOUNDATION FOR ...

### SERVICE BASED USE CASES

- Transactional Apps with the ABAP RESTful Application Programming Model
- Multidimensional data models and analytical reports
- Data integration scenarios e.g., via SQL services
- Read-only scenarios based on CDS entities
- Business eventing
- Enterprise Search

### LOCAL CONSUMPTION USE CASES VIA

- ABAP SQL
- other CDS objects
- ABAP Managed Database Procedures (AMDP)
- major ABAP frameworks

# NEW KIDS ON THE BLOCK

# CDS SIMPLE TYPES

# CDS simple types

## CDS SIMPLE TYPES ...

are user-defined elementary data types in ABAP CDS

can be used instead of a DDIC data element

are available as of 2302 in SAP BTP ABAP Environment, and SAP S/4HANA 2023

More information - [Docu](#) | [Blog Post](#) | [Video](#)

# DDIC data elements and CDS simple types

|                   | DDIC data element  | CDS simple types  |
|-------------------|--|---|
| Availability      | Typing in DDIC, CDS, and ABAP                            | Typing in CDS and in ABAP   |
| Metadata          | Technical settings in SE11                               | CDS annotations for <b>domain-specific metadata</b>                                 |
| Definition        | Form-based editor and DDIC DDL                           | Syntax-based definition in ADT  |
| Framework support | Supported by technologies such as Web Dynpro and SAP GUI | Supported by frameworks such as the RAP Query Engine and the ABAP Analytical Engine |

# CDS simple types - definition

## TYPING WITH A BUILT-IN DATA TYPE

```
@EndUserText.heading: 'First name'  
define type demo_bt_first_name: abap.char( 30 );
```

## STACKING OF SIMPLE TYPES

```
define type demo_simple_type_2 : demo_simple_type;
```

## SIMPLE TYPE BASED ON A DATA ELEMENT

```
define type demo_simple_type_de : demo_destination;
```

# CDS simple types – usage in a CDS view entity

## CDS VIEW ENTITY

```
define view entity DEMO_CDS_SIMPLE_TYPE_USAGE
  with parameters
    p1 : demo_simple_type,
    p2 : abap.int4

  as select from demo_expressions
  {
  ...
  cast( char2 as demo_simple_type_de ) as cast_bt
  }
```

# CDS simple types – usage in ABAP

ABAP

```
DATA MyType TYPE demo_simple_type.  
MyType = 1.
```

# CDS ENUMERATED TYPES

# What is an enumerated type?

**An enumerated type is a data type that specifies a fixed set of values.**

**Objects typed with an enumerated type can have only one of the predefined values.**

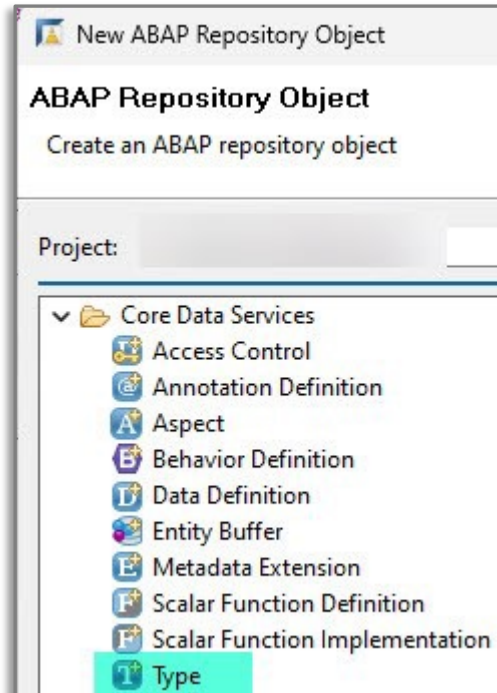

More information - [Docu](#) | [Blog Post](#)

# CDS enumerated types - motivation

## **CDS ENUMERATED TYPES MAKES ENUMERATIONS GLOBALLY AVAILABLE AND REUSABLE IN DIFFERENT CONTEXTS**

- CDS enumerated types vs. DDIC domains with fixed values
- CDS enumerated types vs. ABAP enumerations
- Leveraging CDS qualities

# CDS enumerated types - definition example (1/2)

```
[ALX] DEMO_CDS_ENUM_WEEKDAY ×
1 @EndUserText.label: 'Days of the week'
2 define type DEMO_CDS_ENUM_WEEKDAY : abap.int1 enum
3 {
4   @EndUserText.label: 'Monday'
5   MON = initial;
6   @EndUserText.label: 'Tuesday'
7   TUE = 1;
8   @EndUserText.label: 'Wednesday'
9   WED = 2;
10  @EndUserText.label: 'Thursday'
11  THU = 3;
12  @EndUserText.label: 'Friday'
13  FRI = 4;
14  @EndUserText.label: 'Saturday'
15  SAT = 5;
16  @EndUserText.label: 'Sunday'
17  SUN = 6;
18 }
```

# CDS enumerated types - definition example (2/2)

## STACKING OF CDS ENUMERATED TYPES

```
[ALX] DEMO_CDS_ENUM_WEEKDAY [ALX] DEMO_CDS_ENUM_STACK ×  
1 @EndUserText.label: 'CDS enum typed with another enum'  
2 define type DEMO_CDS_ENUM_STACK: DEMO_CDS_ENUM_WEEKDAY
```

Code element  
info (F2)

|   |                  |
|---|------------------|
| <b>T</b> DEMO_CDS_ENUM_STACK in <b>+</b> sabapdemos<br>CDS enum typed with another enum |                  |
| <b>Base Type</b>  | <b>Data Type</b> |
| <b>T</b> DEMO_CDS_ENUM_WEEKDAY  | <b>int1(3)</b>   |
| <b>Enum Constant</b>  | <b>Value</b>     |
| ● MON   | 0 (initial)      |
| ● TUE   | 1                |
| ● WED   | 2                |
| ● THU   | 3                |
| ● FRI   | 4                |
| ● SAT   | 5                |
| ● SUN   | 6                |

# CDS enumerated types - usage example (1/3)

## USING CDS ENUMERATED TYPES IN CDS VIEW ENTITIES

```
[ALX] CDS_ENUM_USAGE x
1 @EndUserText.label: 'Enum usage'
2 @AccessControl.authorizationCheck: #NOT_REQUIRED
3 define view entity CDS_ENUM_USAGE
4   with parameters
5     p_weekday : DEMO_CDS_ENUM_WEEKDAY
6   as select from DEMO_CDS_ENUM_2
7   {
8     key id,
9     int1,
10    cast(int1 as DEMO_CDS_ENUM_WEEKDAY) as weekday1,
11    DEMO_CDS_ENUM_CHAR.#first_value    as EnumConstant
12  }
13 where
14   weekday = $parameters.p_weekday
```

CDS ENUMERATED TYPES CAN ALSO BE USED ...

in CDS projection views, CDS custom entities, and CDS abstract entities

for casting, typing, parameter passing, as operand of a CASE expression, and operand in the SELECT list

# CDS enumerated types - usage example (2/3)

## USING CDS ENUMERATED TYPES IN ABAP

```
▶ P CDS_ENUM_DEMO ▶  
1 REPORT CDS_ENUM_DEMO.  
2  
3 DATA wd TYPE demo_cds_enum_weekday.  
4  
5 ASSERT wd = demo_cds_enum_weekday-mon.  
6  
7 cl_demo_output=>display( demo_cds_enum_weekday ).
```

```
DEMO_CDS_ENUM_WEEKDAY  
FRI MON SAT SUN THU TUE WED  
FRI MON SAT SUN THU TUE WED
```

# CDS enumerated types - usage example (3/3)

## USING CDS ENUMERATED TYPES IN ABAP SQL

### Comparison in a WHERE-clause

```
1 CDS_ENUM_DEMO ▶
2 REPORT cds_enum_demo.
3 *fill database table
4 DELETE FROM demo_ddic_types.
5 INSERT demo_ddic_types FROM TABLE @( VALUE #(
6   ( id = 'A' intl = 1 )
7   ( id = 'B' intl = 6 )
8   *( id = 'C' intl = 7 )  -> runtime error because 7 is not an allowed value
9 ) ).
10
11 *SELECT from cds view entity
12 SELECT *
13 FROM demo_cds_enum_2
14 INTO TABLE @DATA(result)
15 WHERE EnumConstant = @demo_cds_enum_char-first_value.
16
17 *display result
18 cl_demo_output=>display( result ).
```

### Parameter passing

```
1 CDS_ENUM_DEMO ▶
2 REPORT cds_enum_demo.
3
4 SELECT *
5 FROM demo_cds_enum_3( p_weekday = @demo_cds_enum_weekday-fri )
6 INTO TABLE @DATA(result).
7 cl_demo_output=>display( result ).
```

# CDS SCALAR FUNCTIONS

# CDS scalar functions

A SQL-based scalar function is a user-defined function that accepts multiple input parameters and returns exactly one scalar value

It allows developers to encapsulate complex algorithms into manageable, reusable code that can be used in CDS entities and in ABAP

A scalar function is linked with an AMDP function in which it is implemented using SQLScript

More information - [Docu](#) | [Blog Post](#) | [Video](#)

# DEMO EXAMPLE

Is a delivery subject to import duties?

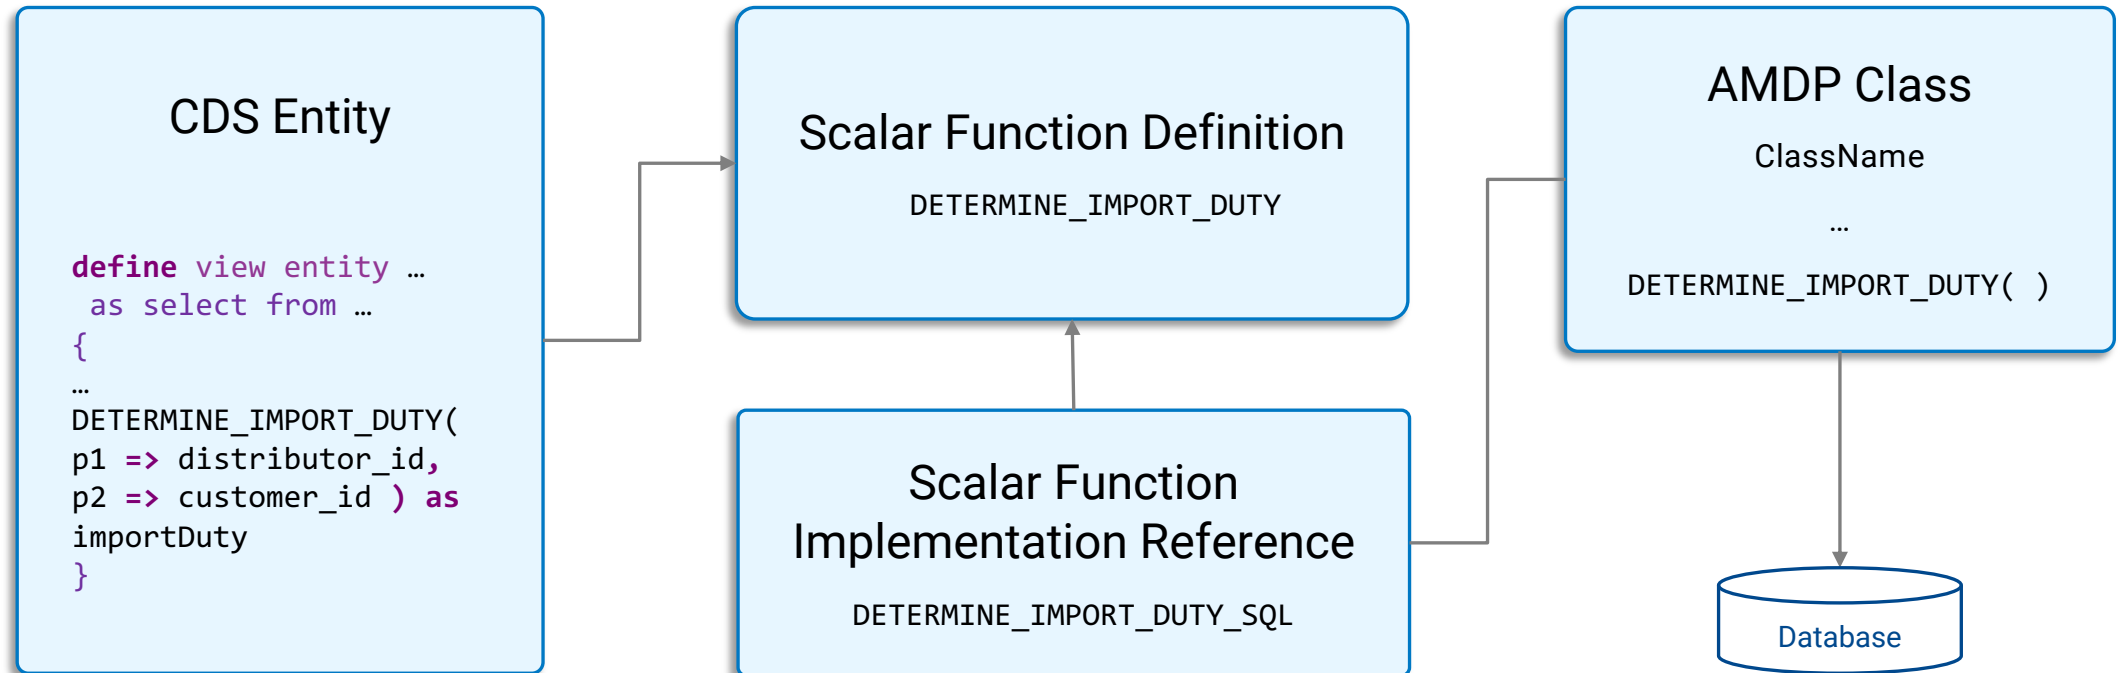

## PACKAGING INFORMATION

```
distributor_id;  
customer_id;  
...  
import_duty;  
...
```

## FUNCTION

```
determine_import_duty( distributor_id, customer_id )
```

# Design time

# CDS scalar functions - definition

1

## DEFINE THE CDS SCALAR FUNCTION DEFINITION

```
define scalar function DETERMINE_IMPORT_DUTY
with parameters
  distributor_id: abap.int2,
  customer_id: abap.int2
returns boolean;
```

2

## DEFINE THE CDS SCALAR FUNCTION IMPLEMENTATION REFERENCE

### Scalar Function Implementation Reference: DETERMINE\_IMPORT\_DUTY\_SQL

#### General Information

Scalar Function Name: \* [DETERMINE\\_IMPORT\\_DUTY](#)

Engine:

AMDP Reference: \*

3

## AMDP FUNCTION IMPLEMENTATION

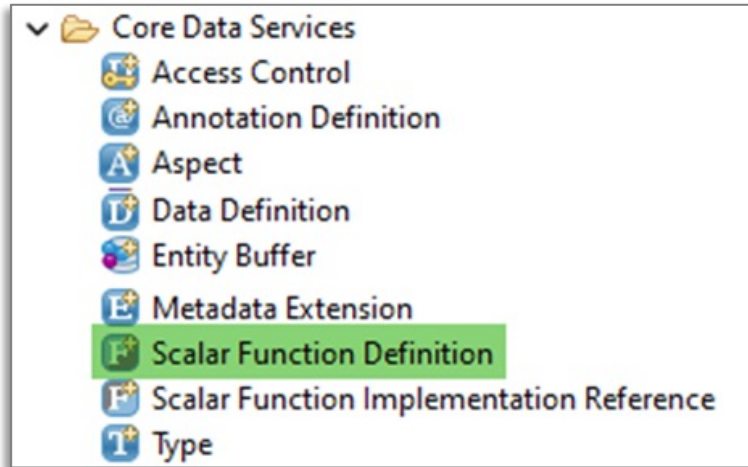

```
CLASS cl_packaging_information
IMPLEMENTATION.
  METHOD determine_import_duty BY DATABASE
FUNCTION
FOR HDB
LANGUAGE SQLSCRIPT
OPTIONS READ-ONLY.
//implementation goes here
ENDMETHOD.
```

# CDS scalar functions - usage example

## USING CDS SCALAR FUNCTIONS IN A CDS VIEW ENTITY

```
define view entity abapconf_packaging_information
with parameters
  distributor_id : abap.int2,
  customer_id : abap.int2
as select from abapconf_I_CUSTOMER as Customer
  inner join abapconf_I_DISTRIBUTOR as Distributor on
    Distributor.DistributorId = $parameters.distributor_id
{
...
determine_import_duty( distributor_id => $parameters.distributor_id,
                      customer_id => $parameters.customer_id ) as
  ImportDuty
}
```

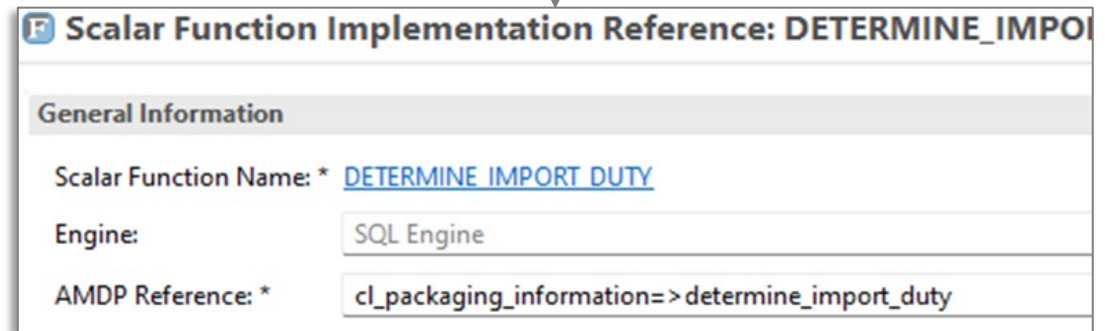

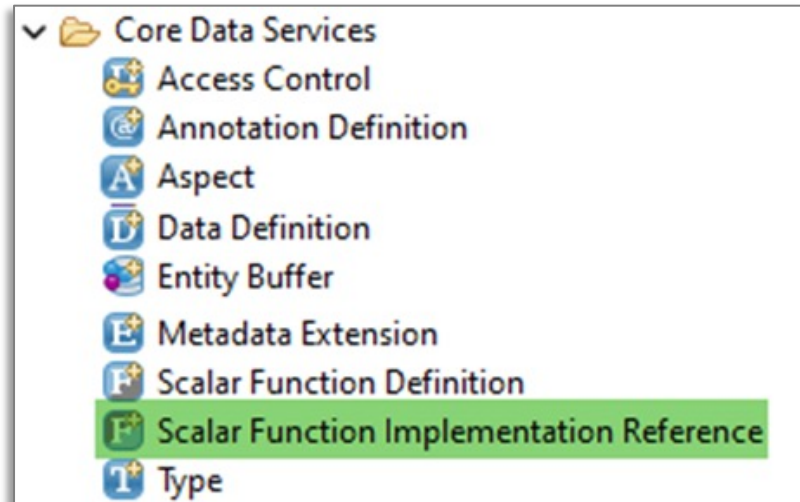

# CDS scalar function definition

```
define scalar function determine_import_duty
with parameters
  distributor_id: abap.int2,
  customer_id: abap.int2
returns Boolean
```

# CDS scalar function implementation reference

# Implementation in an AMDP method

## IMPLEMENTING A CDS SCALAR FUNCTION IN AN AMDP METHOD

```
METHOD determine_import_duty BY DATABASE FUNCTION
                                FOR HDB
                                LANGUAGE SQLSCRIPT
                                OPTIONS READ-ONLY

    USING abapconf_i_customer
          abapconf_i_distributor
          abapconf_i_country.

    declare is_distr_country_eu_member, is_cust_country_eu_member char( 1 );
    declare distr_country_code, cust_country_code char( 2 );
    SELECT country INTO distr_country_code FROM abapconf_i_distributor WHERE distributorid = distributor_id;
    SELECT country INTO cust_country_code FROM abapconf_i_customer WHERE customerid = customer_id;

    SELECT iseuropeanunionmember INTO is_distr_country_eu_member FROM abapconf_i_country WHERE country
       = distr_country_code;
    SELECT iseuropeanunionmember INTO is_cust_country_eu_member FROM abapconf_i_country WHERE country = cust_country_code;
    IF NOT ( is_distr_country_eu_member = 'X' AND is_cust_country_eu_member = 'X' )
    then
        result = 'X';
    END if;
ENDMETHOD.
```
